Summary

Computer Engineering graduate (GPA 3.80/4.00, final results pending) who automates how software is built, shipped and run: CI/CD pipelines in GitHub Actions and Jenkins, infrastructure as code on AWS with Terraform and Ansible, multi-service Docker stacks, and Prometheus/Grafana monitoring. All projects below are public on GitHub.

Education

University of Ruhuna – BSc (Hons) Computer Engineering 2021 – 2026 | **GPA 3.80 / 4.00**
All final examinations completed September 2026; results expected November 2026.

Technical Skills

CI/CD	GitHub Actions (caching, self-hosted runners), Jenkins pipelines (approval gates), SonarQube, GHCR
Cloud & IaC	AWS (EC2, IAM, security groups), Terraform, Ansible, Linux, systemd, Nginx
Containers	Docker, Docker Compose (multi-file overlays, health checks, restart policies)
Observability	Prometheus, Grafana, InfluxDB, alerting rules, tamper-evident audit logging
Platforms	Apache Kafka (3-broker cluster, Debezium CDC), PostgreSQL, Spark, Airflow, Hyperledger Fabric
Languages	Bash, Python, TypeScript, SQL

Projects

Exam & Certification Platform / *Docker, GitHub Actions, Jenkins, Kafka* GitHub: exam-certification-platform

- Built the delivery pipeline for 8 microservices: GitHub Actions CI with dependency caching, a SonarQube quality gate on a self-hosted runner, and images tagged by git SHA pushed to GHCR.
- Jenkins CD pipeline: pull from GHCR, deploy to staging, smoke tests, **manual approval gate**, production tag and post-deploy health check.
- Ran the full 26-container stack in Docker Compose (6 PostgreSQL databases, 3 Kafka brokers, Debezium, MinIO, SonarQube, Jenkins) with 20 health checks and restart policies.

CI/CD Automation with Jenkins / *Jenkins, Terraform, Ansible, AWS EC2, Docker*

- Multi-stage Jenkins pipeline for a Next.js app (checkout, install, test, Docker build and push), with the AWS EC2 environment (security groups, IAM role) provisioned by Terraform and configured by Ansible.
- Zero-downtime container restarts and separate staging and production parameters, with no manual steps.

Smart Grid Lambda Platform / *Docker Compose, Kafka, Spark, Airflow, Grafana* GitHub: smart-grid-lambda-platform

- Containerised 7 services with per-service Dockerfiles and a layered Compose setup (base infrastructure plus processing overlay) driven by Make targets; Airflow DAG with sensors and data-quality checks.
- Prometheus metrics, Grafana dashboards and an alert engine for data gaps, SLA breaches and reject rates; **127 tests**.

TradeBot / *Python, systemd, Linux, SQLite* GitHub: TradeBot

- Deployed to a Linux server via an rsync deploy script and systemd units with automatic restart; secrets shipped with owner-only permissions and dependencies locked for reproducible installs; **84 tests**.

Secure Comms & Traffic Observability / *Docker, InfluxDB, Grafana* GitHub: secure-comm-observability

- Team of 2: Docker Compose stack for an end-to-end encrypted chat (ECDH, ECDSA, AES-256-GCM) with a Scapy sniffer feeding real-time traffic metrics to InfluxDB and Grafana, plus a hash-chained, tamper-evident audit log.

SENTINEL: Attack Detection for Vehicular Networks / *C++, Docker, Fabric* GitHub: MPTD-PQS-SDVN

- Final-year research (team of 4, lead developer): integrated ONNX Runtime and OpenFHE into the NS-3 C++ build, ran a Hyperledger Fabric network in Docker, and added a pre-commit hook that blocks stale generated docs.

Experience

MO Marketplace – Client-side Product Owner (Intern) Colombo, Sri Lanka | May 2025 – Nov 2025

- Gated every fortnightly mobile release with UAT and regression testing, triaging issues with the engineering team.
- Wrote the SQL behind Apache Superset dashboards on the production PostgreSQL schema to monitor user activity and product health after releases; managed the Jira backlog between stakeholders and engineering.

Achievements

Top 10 national finalist, Agentrix 2026 | **Top 5 finalist**, Eminence (University of Ruhuna) | CodeSprint, CTF, CodeFest AI Hackathon, Haxtream | Volunteer District Coordinator, Mehewara Seminar Series
